

Introduction

Namespace Hse.EviDense

Classes

[AdcResult](#)

Represents the ADC values.

[Channel](#)

Represents a measurement channel with sample and reference values, measured in uV.

[Device](#)

This class represents the eviDense module.

[Dict](#)

Defines constant dictionary keys used in measurement processing.

[Factors](#)

Correction factors due to different light absorption at different wavelengths of the cuvette.

[LevellingChannelResult](#)

Represents the result of a levelling operation for a single measurement channel.

[LevellingResult](#)

Represents the overall levelling results for multiple measurement channels.

[Measurement](#)

Represents a measurement containing baseline, air, and sample values, along with optional comments.

[Quadruple](#)

Represents a quadruple set of measurement values at different wavelengths. This class performs mathematical operations (plus, minus, ...) on all four wavelengths at the same time.

[Results](#)

Represents the results of a nucleic acid analysis, including DNA and RNA concentrations and purity ratios.

[SelfTestResult](#)

Represents the result of a self-test, containing various checks and problem indicators.

[SingleMeasurement](#)

Represents a single measurement consisting of multiple wavelength channels.

[StorageMeasurement](#)

Handles storage and retrieval of measurements using JSON serialization.

[USB](#)

Provides USB-related constants.

Enums

[Amplifier](#)

Enumeration representing the two amplifiers.

[AmplifierFactors](#)

Enumeration representing amplification factor of the amplifiers.

[Error](#)

Enumeration representing various error codes.

[Index](#)

Enumeration representing different index values for hardware configurations.

[Led](#)

Enumeration representing different led wave lengths.

[Selftest](#)

Flags enumeration for self-test components.

[StatusLedColor](#)

Enumeration representing different status led colors .

[TypeOf](#)

Enumeration representing different data types.
